The BOVINOSE project ([www.bovinose.eu](http://www.bovinose.eu)) aims to develop an “electronic nose” to detect estrus in a dairy cow, and thus to determine the optimal timing of artificial insemination. The physical principle is based on detection of sex pheromones that are secreted by the cow, exclusively during estrus. These pheromones are the natural olfactory signal for the bull that the cow is in heat. This technology aims to help the dairy farmers in the EU, the vast majority being micro-enterprises run as family businesses.

**INTRODUCTION**

To control the calving interval, and therefore to optimize milk production and maximize offspring in dairy cattle, artificial insemination is widely used.

- Farmers detect around 35%-60% of the heats (=estrus).
- Estrus detection is not always easy.
- Skills of the person performing the detection are relevant.
- Using a real bull may be impractical (costly, dangerous).

Improving the success rate will significantly increase a dairy farmer’s profitability.

**ELECTRONIC NOSE**

- Acetic acid and propionic acid were identified as volatile sex pheromone components.
- Bull is able to detect these and gives a sexual response. (Sankar et.al., 2008).

Electronic nose specific to these pheromones:

- Sensor array of 8 sensors.
- Optimized to detect sex pheromones.
- Reduced sensitivities for other gasses (selectivity).
- Each sensor different sensitivity and selectivity.
- Single sensor is insufficient -> array.

- Array signal -> self learning pattern recognizer -> estrus detection

Prototype device: to demonstrate feasibility of recognizing estrus in real feces. Miniaturization for practical use of later concern.

**ESTRUS PREDICTION**

- Leave-one-cow-out training and test procedure for estrus prediction.
- Total of 10 cows.
- Training considered only on non-pregnant state.
- Variability between cows -> needs calibration per cow.
- Prediction accuracy : 0.5-1 day compared to human observation.
- Untypical hidden estrus: still problematic.

**ACKNOWLEDGMENTS**

The BOVINOSE project is co-funded by the European Commission within the Seventh Framework Programme (2007-2013), Research for the benefit of SMEs, Grant Agreement no: 232460.

SMEs participating in BOVINOSE:

- Precizika Metrology UAB, Lithuania; Complex sp. z o.o., Poland
- NIFA Instruments BV, The Netherlands
- IMV Technologies SA, France
- Aveskamp, The Netherlands
